

The following tick chart shows the SELEKT products most suitable for various common conditions in which oral fluid therapy is advised. The SELEKT formulae are intended for delivery into the rumen, using a SELEKT pump-drencher.

1. In cases of mild dehydration, one sachet of the most appropriate SELEKT formula should be used in 20 litres of warm water. Where dehydration is moderate or severe, additional fluids are advised. Beyond three days after calving, an additional sachet of SELEKT Restore may be given in a further 20 litres of warm water. For cows in the first three days after calving, one sachet of SELEKT Fresh Cow 500 may be mixed in 40 litres of warm water. Never use two sachets of SELEKT Fresh Cow 500 or SELEKT Off Feed and never use the two products together.
2. In cases of acute rumen acidosis, one sachet of SELEKT Antacid should be used in 20 litres of warm water for adult cattle and proportionately less for immature animals.
3. SELEKT Glycerol Plus should be given with at least an equal volume of warm water. It contributes no solute, so when used with a solution of another SELEKT formula, no additional water is required.

	SELEKT Antacid	SELEKT Charbon Fluide™ Activated Charcoal Liquid	SELEKT Fresh Cow 500	SELEKT Glycerol Plus	SELEKT Off Feed	SELEKT Restore
Acute rumen acidosis <u>or</u> sub-acute ruminal acidosis	✓	± ✓				
For fresh cows <u>or</u> following Caesarean section			✓	± ✓	✗	✗
Diarrhoea caused by mycotoxins or bacterial infection		✓				✓
Dehydration or endotoxaemic shock caused by mastitis, metritis, traumatic reticulitis etc.						✓
